My first machine, constructed when I was eleven years of age, was a high potential apparatus, giving about 30, 000 volts or thereabouts. It was a frictional electric machine, the main part being a wine-bottle revolved upon an axis, to which was added the usual rubber, silk flap, and prime conductor. Electrical development on the large scale has in the past few years been going on in the direction of increase of electrical pressures, or increase of potential differences, and this fact gives a renewed interest. The prime cause of all electrical manifestations is, of course, difference of pressure or potential. That we have much more to learn in this fascinating field is evidenced by the condition of our knowledge in regard to the phenomena of lightning, the aurora, comets tails, and possibly, also, of the solar corona. It is about one hundred years since Volta studied the voltaic battery and gave to the world a source of steady currents at low pressure. Long before that, however, the older experiments of the development of electric charges by friction, and the properties of charged bodies had been studied and wondered at. Priestley, in his History of Electricity, a work of nearly 800 pages, has even given expression to the opinion that, In electricity there is the greatest room to make new discoveries. It is a field but just opened, etc. His book was published in the latter part...
